Description			
<p>if we compile a tango device with Lima there is an issue with a #define RGB24 which is also defines by tango < 8.1.2c</p> <p>Lima define an Enum in Constants.h which contian also a RGB24 this cause a FTBFS (fail to build from the source)</p> <p>So the question is what is the good way to solve this issue</p> <p>should we undef this RGB24 right after the #include <tango.h></p> <p>or just before the Enum in Lima by putting a #undef RGB24</p> <p>thanks</p> <p>Fred</p>
